This sequence is a fusion protein of HCC and Jun. The invention claims acqueated to forming a cystelia knot brotein (i) having alpha calcless to a method of forming a cystelia knot brotein (ii) having alpha and beta-subunits comprising attaching a dimerisation domain (DD) to either the Nitermini of both subunits or the Niterminia of the calculation of the calculation of the calculation of the beta-subunit and dimerising the products to form a heterodimeric protein analog (ii). The method is the products to form a heterodimeric protein analog (ii). The method is considered to products analog (iii). The method is considered proportion for promones, potentially useful, e.g. for treating infertility of symmoses of altiques (since a DD may contraining highly antigenic as immunogens or altigens (since a DD may contraining highly antigenic anion acid sequences). Attachment of a DD (which may be removed later) facilitates the formation of heterodimers, that have shall ar structures (and thus receptor-binding and immunogenic properties) to native dimers, and allows the combination of subunits; that would otherwise combine conditied without loss of activity, and attachment of the DD reduces to formation of homodimers. Heterodimers have longer circulation times in vivo than individual subunits.
                                                                                                                                                                   Cysteine knot protein; protein formation; heterodimeric protein analog; deglycostylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hCG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     οŽ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a fusion protein of hGG and Jun. The invention cleares to a method of forming a cysteine knot protein (1) having alpha cleares to a method of forming a cysteine knot protein (1) having alpha and beta-subunits comprising attaching a dimerisation domain (0D) to either the N-termino of both subunits or the N-terminos of the capture of the charmon of deglycopylated used to produce analogues (sponisses or antegonisses) of deglycopylated cyproprotein hormones, potentially useful, e.g. for treating infertility where caused by polycystic ovarian disease (associated with excessive contigens (since a Do may containing highly antigens cannon acid sequences). Attachment of a DD may containing highly antigens cannon acid asquences. Attachment of a DD (which may be removed later) and thus receptor-binding and immunogenic properties) to native dimers, and allows the combination of subunitas that would otherwise combines.

Can allow the combination of subunitas that would otherwise combines of subunitas that would otherwise combines.

Condition of homodimers have subunite that would otherwise combines and the combination of subunits that would otherwise combines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the beta subunit of human chorionic gonadotropin which is used in a method for the treatment or prevention of disease, by increasing production of at least one type of hamatopoletic cell. A method is also described in which non-terminally differentiated hamanopoletic cells are treated in which non-terminally differentiated hamanopoletic cells are treated in vitro to increase proliferation them returned to the patient. The method is specified for treating human humanodeliciency virus (RIV) infection, diopathic fromadocytopaenia purpura, anaemia or neutropaenia, or subjects who have undergone chemotherapy or radiation freatmedt. Nore generally it can be used to them a wide range of conditions involving haematopoletic failure, (non-haematopoletic tumours, autoimmune disease and genetic disorders (using a haematopoletic cells, The in vitro method can also be used to expand haematopoletic cells for subsequent therapeutic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Beta-human chorionic gonadotropin; beta-hCG; hematopoiesic cell;

The invention provides movel vaccine compositions which comprise the beta-subunit of human chorionic gonadotropin (betahcofi) in combination with chitcosin-based adjuvants. The vaccines are used to induce infertility especially translent infertility, in female mammals. The compositions are also used for antibody production. The vaccines comprise a well-tolerated chitcosin-based adjuvant which induces the production of anti-chorionic gonadotroph antibodies, without inducing the side effects (e.g. hypersensitylty, rethman, etc.) associated with other adjuvants. The vaccine also overcomes the problem of non-responsiveness in some individuals. The present sequence respectants betahck/beta-gal fusion protein consisting of leaderless betahcG linked to a beta-gal fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human beta-subunit chorionic gonadotropin vaccines used to integrupe fertility in mammals by the immunological inactivation of the pregnancy hormone chorionic gonadotropin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the production of analogues of a heterodimeric subunit glycoporotein hormone (GH9) a.9, human chorionic gonadotropin (hCG), human inteinishing hormone (HB9), human follicle stimulating normone (HB9), and inteinishing normone (HB9), and inteiniating normone (HB9), and inteiniating normone (HB9), and inteiniating normone (HB9), and inteiniating matching, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the content of the analogue retaining at least a portion of the blancod stability, the analogue retaining at least a portion of the content of the corresponding native GHP receptor. This sequence modified GH9s, the improved analogues are designed specifically to the creduce perturbation of the 3-dimensional structure of the hormon, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonated activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human-chortonic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human ityroid stimulating hormone; stability; primer; amplification; PCR; mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is an analogue of mature hCG beta subunit having residute 89 replaced by a methonine residue. This introduces an additional cleavage site for CWBF, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "normal" disulphide pettern of mandogues, and for examining protein folding.
                                                                                  Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New glyco-protein hormone analogues - for inducing fertility as fimuno-costration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glycoprotein hormone; human chorionic gonadotropin; disulphide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides movel vaccine compositions which comprise the beta-subunit of human chorionic gonddorropin (betahcofin combination with chicksan-based adjuvants. The vaccines are used to induce infertility especially transient infertility, in female mammals. The compositions are also used for antibody production. The vaccines comprise a well-tolerated chicksan-based adjuvant which induces the production of an introduction of sand chicksantivity, erythma, etc.) associated with other adjuvants. The vaccine also overcomes the problem of non-responsiveness in some individuals. The present sequence represents a betahc's fragment fused to an alpha-mating factor leader sequence at the N-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel human beta-subunit chorionic gonadotropin vaccines used to integrate fertility in mammals by the immunological inactivation of the pregnancy hormone chorionic gonadotropin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    63 VRFSSIRLGGCRGVNPVVSTNALGCQCALCRRSTTDCGGFROHPLTCDDPRFQDSSSS 122

the invention relates to the production of analogues of a heterodimeric subunit giyosoprotain hormone (GH9). A shame individuely gonadotrophin (CC (hCG), human intensial promone (HEH), human follicle stimulating hormone (HEH), human follicle stimulating hormone (HEH), human follicle stimulating connect (HEH), human follicle stimulating connect (HEH), which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the containing at least a portion of the CC improved stability, the analogue retaining at least a portion of the Chiacativity for the corresponding native GHP receptor. This sequence containing a mutered hord-beta subunit used for the generation of the modified GHBs. The improved analogues are designed specifically to compense the protection of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have uses as for the native GHBs and prolong as for the native GHBs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analogue; heterodimeric; glycoprotein hormone; hCG; hLB; hFSH; hTSH; human hortoric goradorrophi; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human ftyroid stimulating hormone; stability; primer; amplification; PCR; mutation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is an analogue of mature hCG beta subunit having residue 37 replaced by a histidine residue. This introduces an additional cleavage site for CNBr, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "ormal" disulphide pattern of analogues, and for seamining protein folding.
                                                                                                                                                                                                                                                                                                                                                  New qlyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glycoprotein hormone analogue hCG4beta-V44C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (ISTF ) ARS APPLIED RES SYSTEMS HOLDING NV.

The invention relates to the production of analogues of a heterodimeric subunit glycoprotein hormone (GRB) e.g. human chorionic gonadetropin (hGG), human luteinising hormone (HLM), human follicle stimulating conformating hormone (HLM), human follicle stimulating conformation (hGG), human investment of the stimulating hormone (HRSH), and functional muterins, which are modified to contain an intersubunit dissiphide bond, between an alphar subunit cysteine, for improved stablity, the analogue retaining at least a portion of the improved atablity, the corresponding native GPH this sequence represents a mutated hOC beta subunit used for the generation of the condified GPHs. The improved analogues are designed specifically to reduce perturbation of the 3-dimensional structure of the hormone, therefore dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have the biological activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21 SKEPLRPRCRPINATLAVEKBGCPVCITVNTTCCAGYCPTWTRVLQGVLPALPQVVCNYR 80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                   the invention relates to the production of analogues of a heterodimeric subunit giyosoprotein hormone (GPH) a.9. human chorionic gonadotropin (bCC), human intennising hormone (HBH), human follicle stimulating hormone (HBH), human fulcinistating hormone (HBH), human fulcinistating hormone (HBH), and functional cutteins, which are modified to contain an intersubunit disamphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine, for the contains a minersubunit disamphide bond, cortains to the corresponding native GPH receptor. This sequence biological countries a material Angles retaining at least a portion of the modified GPHs. The improved analogues are designed specifically to complete the presents a material Angles and subunit used for the generation of the modified GPHs. The improved analogues are designed specifically to the reduce perturbation of the 3-dimensional structure of the hormone. The the formed dimer will have affinity for the native receptors and have against a cativity on them. The changes stabilise the GPHs and prolong as for the native GPHs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chortonic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of the beta-subunit of human chorionic gonadorrophin which was used in the creation of a beta-subunit peptide analogue as part of an alpha, beta-heterodimeric polypeptide having an affinity to vertebrate intennising hormone [IR] receptors and vertebrate stimulating homone (FSR) receptors. This can be used for treating human infertility or polycystic ovarian disease.

                                                                                                                                                                                                                                                                                       The sequence is an analogue of mature hCG beta subunit having residues 12 and 27 replaced by methonine residues. This introduces additional cleavage sites for CNBr, useful for decembing the disliphing bonds. This can be used to show that mutageness has not a liered the 'normal' disliphing by the mutageness, and for examining protein folding.
                                                                                                                                                New glyco-protein hormone analogues - for inducing fertility a
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.

The invention relates to the production of analogues of a heterodimeric subulit giycoprotein hormone (GFB) = 9. human chorionic gonadorropin (bCC), human lutefatian hormone (GFB), human thicatians bormone (HEB), human cloilicle stimulating bormone (HEB), human thicatians bormone (HEB), and incortional contents, which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteins and a beta-subunit cysteins of the chimproved stability, the analogue retaining at least a portion of the chimproved stability, the analogue retaining at least a portion of the chimproved stability to compare the corresponding native GPH receptor. This sequence confided GPHs. The improved analogues are designed specifically to compare the corresponding and that the dimer will be formed in vivo and the formed dimer vill have affinity for the native receptors and have confident cattlivity on them. The champes stabilise the GPHs and prolong the bloogical activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analogue; hèterodimeric; glycoprotein hormone; hCG; hLM; hFSH; hTSH; human choritonic gonadotropin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
            This protein sequence represents the beta-subunit of human chorionic goadcorpoin (bGG) which can be used in a novel method for detecting conductive cancers and associated tumours. Not is a dimeric giptoductive cancers and associated tumours hot is a dimeric of jiptoprotein hormone whose beta-subunit is normally used as marker for reproductive tumours in both men and women. The hot beta-subunit can can sayinine specific metalloprotease copable of cleaved by gonadortopin beta-subunit nicking enzyme (GBNE) which is an arginine specific metalloprotease copable of cleaving the hot beta subunit at Arg44 or G1447, but is partially inhibited by phenathholine or temperation over 90 per cent of cancer patients show elevated levels of cleaving the hotse of general in the detection and promposis of cervical.

CC GBNE in thair blood, therefore, specific binding assays for the presence of GBNE are useful in the detection and promposis of cervical.

CC endometrial, ovarian, prostate, testicular, tubal uterine, vaginal or villar cancer GBNE can act marker for high risk screening test, the used to follow herapy for the treatment of known reproductive cancers:

the invention relates to the production of analogues of a heterodimeric subunit giyosoprotein hormone (GRP) 4-9, human chorionic gondedtropin (CC (hCG), human lutefalsing hormone (HCB), human futefalsing hormone (HCB), human futefalsing hormone (HCB), human futefalsing hormone (HCB), and functional canteins, which are modified to contain an intersubunit disupplied bond, between an alpha-subunit cysteine and a beta subunit cysteine and contained bond, beta contracted analogue retaining at least a portion of the hormore and the former and the farmone and the corresponding an attack get segind specifically to complice perturbation of the 3-dimensional structure of the hormone. The teduce perturbation of the 3-dimensional structure of the hormone and the formed dimer will have affinity for the native ceptors and have a sponistic activity on them. The changes stabilise the GPHs and prolong the hologolous and have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human chorionic gonadotrophi, human alucinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation

The sequence represents the amino acid sequence of gonadotropin analogue beta subunit lacking oligosaccharide binding sites. The oligosaccharide binding sites are removed in order to reduce the efficacy of the conditions sites are removed in order to reduce the efficacy of the conditions of the conditions of the sites of the oligosaccharide binding sites are removed in order to reduce the efficacy of the conditions of conditions analogue. Is useful for generating antibodies specifically immone analogue is useful for generating antibodies specifically commone analogue is useful for generating antibodies specifically control forms of the hormones, in the treatment of infertility, as an aid for in civiv fertilisation techniques, and in other therapeutic methods associated with the native hormone. The single chain procein is further useful as a reagent in a manner similar to the heterodimer of antive proteins in the bological samples, as a control reagent in assay (is the proteins in the bological samples, as a control reagent in assay of the single chain forms of the beteodimers or homodimers have the following advantages over their idmeric forms: they are more stable, concliowing advantages over their idmeric forms: they are more stable, concliowing advantages over their idmeric forms: they are more stable, concliowing advantages over their idmeric forms: they are more stable, is needed to transcribe, translate and process, they provide an alternate forms permitting fine tuning of sectivity levels and of in vivo half lives. Single chain forms are unique starting materials for identifying the cutility permitts the protein to be engineered without disturbing the cutility of correcting materials for identifying the control of the protein of the engineer of the suburity of the dimer. The linkage between the control of the protein to be engineered without disturbing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; single chain gonadotropin analog; anti-infertility; drug; peptide therapy; luteiniaing hormone; LH; follicle stimulating hormone; ESH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility.
                                                                                                                                                                                                                                                                      New single chain forms of the glycoprotein hormone quartet useful for generating antibodies specifically immunoreactive with the new compounds in treating infertility, or as aids for in vivo fertilization techniques

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCG beta subunit having residue 40 replaced by a histidine residue. This introduces an additional cleavage site for CNBr, useful for determining the distliphide bonds. This can be used to show that mutagenesis has even the "normal" disulphide pattern of analogues, and for see AARISO43, AARISO61-RISI2S and AARISO61-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human single chain forms of the glycoprotein barmone quarter which is an agoist or antagonist of intensising hormone ([MI), follocis stimulating hormones are herefored merce forms of single chain hormones are used in transported the properties of subject that hormones are used in transported with the native hormones are used in transported with the native hormones are used in transported with the native hormones. The single chain hormones are useful as reaspents that manner stallar to betacolitars, as diagnostic tools to detect the presence of antibodies with respect to the native proteins in blood teal amples, as control respects to the native proteins to be a set also used in affinity chromatographic preparation of receptors or antibomens antibodies. They are used as furgitication tools for antibodies. They are used as furgitication tools for catalsous of subsequent preparations of these materials and to monitor levels of subsequent preparations of these materials and to monitor contitive these new compounds, as substitutes for the heterodimeric forms of beta-subunit coding region lawing as inhelitutes for the heterodimeric forms of the behavior of the subunit is queed for constructing fusion protein analogs are not an analogs serves as useful starting compounds for seepering expecitive forms to be the value of the present serves as useful starting compounds for sequence. This beta-subunit is used for constructing fusion protein analogs serves as useful starting compounds for sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This introduces an additional cleavage size for CHBC, useful for determining the disulphide bonds. This can be used to show that mutagenesis has mot altered the 'normal' disulphide pattern of analogues, and for see AARISGA3. AMRIDGE-RISI2S and AARISIGI-RISI3B.

The invention relates to the production of analogues of a heterodimeric should it givenoprotein hormone (GFB). 9. human chorionic gonadotropin (DGC), human intentials promone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating hormone (HEM), human follicle stimulating connected the content of the stimulating hormone (HEM), and functional matches, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine and a beta subunit cysteine for the content of the chinacetylic of the corresponding native GPH receptor. This sequence confertivity for the corresponding native GPH receptor. This sequence conferting the matched management and season and the content of the 3-dimensional structure of the hormone thereby creating greater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have agonistic activity on them. The changes stabilise the GPHs and prolong the native GPHs and prolong.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analogue; heterodimeric; glycoprotein hormone; hCG; hLH; hFSH; hTSH; human deprionic gonadotrophin; human luteinising hormone; disulphide bond; human follicle stimulating hormone; human thyroid stimulating hormone; stability; primer; amplification; PCR; mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRPQDSSS 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     At the invention relates to the production of analogues of a heterodimeric subunit giycoportein hormone (GPH) = 9. Numan chorionic gondeducropin (NCG), human inteinishing hormone (HER), human inteinishing hormone (HER), human inteinishing hormone (HER), human inteinishing hormone (HER), and functional cuttain, which are modified to contain an intersubunit disuphide bond, between an alpha-subunit cysteine and a beta-subunit cysteine for the containing at least a portion of the biproved stability, the analogue retaining at least a portion of the biproved stability, the analogue retaining at least a portion of the corresponding native GPH receptor. This sequence corresponds a matched hord-beta subunit used for the generation of the confided GPHs. The improved analogues are designed specifically to corresponding areater likelihood that the diener will be formed in vivo and the formed dimer vill have affinity for the native receptors and have affinity and the hologues and the correct and provided and contains the changes stabilise the CPHs and prolong as for the native GPHS is not have uses

The invention relates to the production of analogues of a heterodimeric cobustic ground in the production of analogues of a heterodimeric cobustic glycoprofetin formone (GFM) = 0.9. human robriciont gonadoctropin (horizo), human luteinisty hormone (Hill), human follicle situaliting of concerned (hill), and functional muterins, which are modified to contain an intersubunit disulphide bond, between an alpha-subunit cysteine of the placetivity for the corresponding nettering at least a portion of the improved stability, the analogue retaining at least a portion of the corresponding nettering at least a portion of the represents a mutant hor-beta subunit used for the generation of the represents a mutant hor-beta subunit used for the generation of the reduce perturbation of the 3-dimensional structure of the hormone, thereby creating greater likelihood that the dimen vill be formed in vivo and the formed dimer will have affinity for the native receptors and have capulated activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTfDGGGPKDHPLTCDDPRFQDSSS 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New stabilised glycoprotein hormones - particularly hCG, hLH, hFSH or hTSH, have an intersubunit disulbytde crosslink between the alpha and beta-subunits to improve stability

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the production of analogues of a heterodimeric subunit giycoporcein hormone (GRB) a-9, human chorionic gondoctropin cubulit giycoporcein hormone (GRB), and man inteinialing hormone (RRB), human inteinialing hormone (HRB), human follicle stimulating hormone (HRB), and functional muteins, which are modified to contain an intersubunit disulphide bond, between an alpha subunit cysteine and a beta subunit cysteine, for between an alpha subunit cysteine and a beta subunit cysteine, for the corresponding at least a portion of the blanctivity for the corresponding native GPH receptor. This sequence the presents a mutant hGC beta subunit used for the generation of the creptored analogues red signed specifically to reduce perturbation of the 3-dimensional structure of the hormone, to reduce perturbation of the 3-dimensional structure of the hormone, the bridges are all likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and prolong as for the native GPHS and prolong as for the native GPHS and prolong as for the native GPHS and prolong as for the native GPHS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Analogue la (human CG-beta(1-145)-linker-human CG-alpha(1-92)[N530, N761) is a specific example of a single chain gondoctroph having at chorionic gondoctropin (CG) beta-subunit at the N-terminus and a CG alpha-subunit at the C-terminus, joined by a linker of 1-16 amino acids. The analogue la was derived from qualogue lby removing the two 91ycosylation sites from the alpha-subunit. The analogue has anti-luteinising hormone (lutropin) activity and can be used for secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

The analogue has luteinishing hormone (lutropin) activity and is useful for inducing ovulation and increasing male fertility.

The sequence is an analogue of mature hCG beta subunit having residues 95 and 97 replaced by the corresponding residues in the bovine LM protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antseed and may also have applications as an immunogen, agonist and/or antseed and may also have applications as an immunogen, agonist and/or antseed and may also have applications and manifecture and may applicate and manifecture and may applicate and manifecture an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Indels 0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCG beta subunit having residues 199-144 replaced by histidine residues. This introduces additional cleaves sites for CNBr, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "normal" disulphide pattern of analogues, and for See AMRISO41, AMRISO61-RISI25 and AMRISO61-RISI98.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New glyco-protein hormone analogues - for inducing fertility as
immuno-castration agains, for supressing reproductive system
development and as immuno-contragestive vaccines.

The sequence is an analogue of mature hoc bets subunit having a histidine and a glumanne residue residue inserted between testing the residues of and 5. This introduces an additional cleavage site for CMST, useful for determining the dissiphine bonds. This can be used to show that mutagenesis has not altered the formal disulphine bettern of analogues, and for examining protein folding.

The present sequence is the human chorionic gonadotrophin beta cabbully cabbully cabbully care and in the preparation of a contragestative which can be used in the preparation of a contragestative confederable. The modified beta-hoch has reduced cross reactivity with lutefainsing hormone (LH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hoc an specific immunoassay and for applications where hoc is active, e.g. to specific immunoassay and for applications where hoc is active, e.g. to meuralising antibodies to beta-hoc, which do not cross-react with coher natural immonses.

W. B. Sequence not given in the specification, but constructed using the wild type beta-hoc sequence given in nature 307 959860, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified beta-human chorionic gonadotrophin proteins - useful as contragestative vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                       The present sequence is the human chorionic gonadotrophin beta cabbuilt (beta-NGC), and not returnal loop muthan Val275yr.

The present: The modified beta-NGC has reduced cross reactivity with contents and the preparation of a contragestative medicament. The modified beta-NGC has reduced cross reactivity with lutefainst pornone (LH), as defined by the ability of both proteinsing hormone (LH), as defined by the ability of both be used as a contraceptive in females, in a vaccine, in a hGC specific immunoassay and for applications where hGC is active, or entralising antibodies to beta-hGG, which do not cross react with coher netural hormones.

N. B. Sequence not given in the specification, but constructed using the wild type beta-hGG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Caps

The subtitution introduces an additional cleavage site for CMBr, useful for determining the disuphide bonds. This can be used to show that mutagenesis has not altered the 'normal' disulphide pattern of analogues, and for examining protein folding. See AMRIS041, AMRIS061-RIS125 and AMRIS161-RIS198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the human chorionic gonadorrophin beta subunit (beta-hCG), carboxy-terminal loop mutant Arg45se, witho can be used in the preparation of a contragestative; medicament. The modified beta-hCG has reduced cross-reactivity with luceinising hormone (Lis), as defined by the ability of both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; chorionic gonadotrophin; chorionic gonadotropin; beta-hCG; beta subunit; anino-terminal loop; mutant; reduction; LM; vaccine; contragestative medicament; cross-reactivity; luteinising hormone; contraceptive; immunoassay; Kaposi sarcoma; inhibition; neutralising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified beta-human chorionic gonadotrophin proteins - useful as contragestative vaccine
                                                                                                                                                                                                                                                     Onery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                            The sequence is an analogue of mature hCG beta subunit having residues 77, 82, and 83 replaced by the corresponding residues in the human LH protein. The chimaric hormone may be useful in the treatment of infertility in men and women any promotion of fertility in male and female and immiles. See AMRISO43, AMRISO61-RIS125 and AMRISO61-RIS198.
New glyco-protein hormone analogues - for inducing fertility is immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Owery Match 97.34; Score 756; DB 12; Length 145; Bet Local Similarity 97.94; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 SKEPLRPRCRPINATLAVEKEGCPVCITVNTTICAGYCPTMTRVLQGVLPALPQVVCNYR 61
      subunit (beta-hCG), carboxy-terminal loop mutant val79His, which can be used in the preparation of a contragestation the can be used in the preparation of a contragestativity with intelnishing hormone (id), as defined by the ability of both proteins to react with the same antibody. The medified beta-hCG can be used as a contraceptive in females, in a vaccine, in a hCG specific immunoassay and for applications where hCG is active, e.g. Raposi sarcoma inhibition. The medified beta-hCG can produce neutralishing antibodies to beta-hCG, which do not cross-react with chem natural hormones.

W. B. Sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Location/Qualifiers

proteins to react with the same antibody. The modified beta-hGG can be used as a contraceptive in females, in a vaccine, in a hGG specific immunoassay and for applications where hGG is active, e.g. Rapost asrcoma inhibition. The modified beta-hGG can produce neutralising antibodes to beta-hGG, which do not cross-react with other natural hormones.

N.B. Sequence not given in the specification, but constructed using the wild type beta-hGG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chorionic gonadorrophin; chorionic gonadotropin; beta-hCG; beta subunit, amino-terminal loop; mutant; reduction; LH; vaccine; contragestrive medicament; cross-reactivity; lucenising hormone; contraceptive; faminossay; kaposi sarcoma; inhibition; entralising northood;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the human chorionic gonadotrophin beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
The sequence is an analogue of mature hCG beta subunit having residues 55, 56, and 58 replaced by the corresponding stations in the hFSH protein. It was propd: by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and famels and may be useful.
                                           New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

Removal of the glycosylation sites, particularly from the alpha subunit, has been shown to reduce hormone efficacy and inhibit signal transduction. The present sequence is that of the hCG beta-subunit from which none of the two native glycosylation sites has been removed using strand overlap PCR.
                                                                                                                                                                                               Methods for altering fertility in mammals, esp. humans - e.g. stimulating fertility by reducing the activity and/or levels of circulating glyco:protein hormones having lutropin activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ouery Match

subunit (beta-hGG), carboxy-terminal loop mutant Gly75His, with can be used in the preparation of a contragetative with can be used in the preparation of a contragetative with can endicament. The modified beta-hGG has reduced cross-reactivity with trefinishing bormone (LH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hGG can be used as a contraceptive in females, in a vaccine, in a hGG CG specific immunosassy and for applications where hGG is active, e.g. Raposi sarcoma inhibition. The modified beta-hGG can produce CG netralising antibodies to beta-hGG, which do not cross-react with other natural hormones.

CE NB. Sequence not given in the specification, but constructed using the wild type beta-hGG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                  The sequence is an analogue of mature hCG beta subunit having residues 94.96 replaced by the corresponding residues in the equine LH protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antagonist. See ARRISO61-RISI25 and ARRISO61-RISI99.

The invention relates to the production of analogues of a heterodimeric subunit giycoprotein hormone (GPR), 9, human obtoinoic gonadotropin (CC (hCG), human lutefalials hormone (HCB), human intendising hormone (HCB), human intendising hormone (HCB), human intendising hormone (HCB), human intendising hormone (HCB), and intendising hormone (HCB), and intendising the more decisions and the series are subunit orgateins, which are modified to contain an intersubunit disupplied bond, between an alpha-subunit cysteine and a beta-subunit orgateins, for improved stability, the analogue retaining at least a portion of the blocativity for the corresponding native GPF receptor. This sequence corresponding and produce and the generation of the characteristic proved analogues are designed specifically corresponding preater likelihood that the dimer will be formed in vivo and the formed dimer will have affinity for the native receptors and have associated activity on them. The changes stabilise the GPHs and prolong the bloopicial activities of the hormones. The analogues can have uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

                                                                The present sequence is the human chorionic gonadotrophin beta couldn't beta-hCG), andno-terminal loop mutant Proteitis.

Which can be used in the preparation of a contragestative medicament. The modified beta-hCG has reduced cross recentivity with luteinisting hormone (LH), as defined by the ability of both proteins to react with the same antibody. The modified beta-hC can be used as a contraceptive in females, in a vaccine, in a hCC specific immunoassay and for applications where hCC is active, e.g. Kaposi sarcoma inthistion. The modified beta-hCC can produce to metural hormones.

When sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40 (1984).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

                                                     The sequence is an analogue of mature hCG beta subunit having residues 112-115 replaced by the corresponding residues in the equine ill protein. The chimeric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist sed AAR15043, AAR15061-R15125 and AAR151-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is an analogue of mature hCG beta subunit having residues 94-97 replaced by the corresponding residues in the hFSH protein. It was prepd. by site directed mutagenesis of a cown sequence encoding the hCG beta subunit. The chimeric charmone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New qlyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Glycoprotein hormone; fertility; immuno-castration;

This sequence represents a fusion protein of the human chorionic gonadorrophin (htdc) beta subunit and Jun. The invention relates to a genedorrophin (htdc) beta subunit and Jun. The invention relates to a method of forming a cysteine knot protein (1) having alpha and beta subunits comprising attaching a dimerisation domain (DD) to either the N-terminol of both subunits or the N-terminol of the alpha-subunit and thereinsing the products to compress the N-terminol of the products to the N-terminol of polys bubmits or the N-terminol of the alpha-subunit and a heterodimeric protein analog (III) The method is used to produce analogues (sponists or artagonists) of deglycosylated glycoprotein hormones, procentally used. For treating infertility where caused to projective to a proper analogues (sponists) of deglycosylated glycoprotein caused by polycystic ovarian disease (associated with excessive levels of immunogens or antigens (since a DD may containing highly antigenic anno acid sequences). Attachment of a DD (which may be removed later) and allows the combination of subunits that would otherwise combine properties). On acid sequences, and allows the combination of subunits that would otherwise combine productive and allows the combination of authority, and attachment of the DD reduces to poolly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; autigen; polycystic ovarian disease; hGG; human; chorionic gonadotrophin; bera subunit; therapy; Jun.

The invention relates to a genetic of genedocrophin (HCG) beta subunit and Jun. The invention relates to a method of forming a cysteine knot protein (1) having alpha and comethod of comprising attaching a dimerisation domain (DD) to either the N-terminus of the alpha-subunit and the C-terminus of the beta-subulit and dimerisation domain (DD) to either the N-terminus of the beta-subulit and dimerisation domain of the order of an alogues (agonists or antagonists) of deglycosylated pyroprotein chargeness, potentially useful, e.g. for treating infertility where caused to produce the normal disease (associated with excessive levels of clutentialing bemone). Products that retain DN's are also useful as actil sequences). Attachment of a DD (which may be removed later) facilitates the formation of hecrodimers, that have similar structures and allows the combination of subunits that would other-view composition and allows the combination of subunits that would other-view composition produces and allows the combination of subunits that would other-view composition of homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cysteine knot protein; protein formation; heterodimeric protein analog; deglycoglyted glycoprotein hormone; infertility; immunogen; antigen; polycystic ovatian disease; hGG; human; chorionic gonadotrophin; beta subunit; therapy; Jun.

The break-hCG has reduced from official promone (iff), as defined by redead into both proteins to react with the same antibody. The medicaled beta-hCG can be used as a contraceptive in Genales, in a vaccine, in a hCG specific immunoassay and for applications where hCG is active, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; chorionic gonadotrophin; chorionic gonadotropin; beta-hCG; beta subunit; amino terminal loop; mutant; reduction; LH; veccine; contragestative medicament; cross-reactivity; lucinising hormone; contraceptive; miminossay; Raposi sarcoma; inhibition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the human chorionic gonadotrophin beta subunit (beta-hCG), carboxy-terminal loop mitant of 19/1Mrg.

Largy-deer, which can be used in the preparation of a contragestative medicament. The modified beta-hCG has reduced cross reactivity with lutelainship hormone (iH), as defined by the ability of both both lutelainship hormone (iH), as defined by the ability of both beta-hCG can proteins to react with the same anti-body, the modified beta-hCG can specific immunoassay and for applications where hCG is active, e.g. Kaposi sarcoma inhibition. The modified beta-hCG can produce constraints and hormones to beta-hCG, which do not cross-react with constraint hormones.

N.B. sequence not given in the specification, but constructed using the wild type beta-hCG sequence given in nature 307 959460, 37-40 (1984).
                                                                       Chorionic gonadotrophin beta subunit carboxy-terminal loop mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                              maman: chorionic gonadorrophin; chorionic gonadorropin; beta-NGG; beta subunit; amino-terminal loop; mutant; reduction: LH; vaccine; contragestrive medicament; cross-reactivity; luceinising hormone contraceptive; mamnoassay; kaposi sarcoma; inhibition; energalising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified beta-human chorionic gonadotrophin proteins - useful as contragestative vaccine

and allows the combination of subunits that would otherwise combine poorly, or not at all. The Wrettrainal part of a glycoprotein hormone may be modified without loss of activity, and attachment of the DD reduces formation of homodimers: Reterodimers have longer circulation times in vivo than individual subunits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      this sequence represents a fusion protein of the human chorionic conductorphin (HCC) alpha subunit and Fos. The invention relates to a conductorphin (HCC) alpha subunit and Fos. The invention relates to a control of comming a cysteine knot protein (1) having alpha and control of comprising attaching a dimerisation domain (DD) to either the N-termini of both subunits or the N-terminis (DD) to either the N-terminis of the alpha-subunit and control of a polycyptic ovariand disease (associated with excessive levels of intentialing homeone). Products that rectain DD's are also useful as a functional sequences or antigents of a DD (which may be removed later).

Confidentialing control of the protection of the control of the alpha-subunity antigenic annot confident thus receptor-binding and immunogenic properties) to native dimers,
                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGG; human; chorlonic gonadotrophin; alpha subunit; therapy; Pos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methods for producing heterodimers, particularly analogues of hormones, from subunits of cysteine knot proteins -

                                    The sequence is an analogue of mature hCG beta subunit having residues 86, 87, 89, 91 and 92 repishede by the corresponding residues 86, 87, 89, 91 and 92 repishede by the corresponding receives in the hFSH protein. It was propd. by site directed mutagenesis of a CDNA sequence encoding the hCG beta subunit. The chimeric hormone is capable of directing hormone blanding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals. (See ANRISO41, ANRISO61-RISI25 and ANRISI61-RISI38).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Kaposi sarcoma inhibition. The modified beta-hCG can produce neutralising antibodies to beta-hCG, which do not cross-react with orber natural hormones.

N.B. Sequence not given in the specification but constructed using tibe wild type beta-hCG sequence given in nature 307 959466, 37-40 (1984).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is an analogue of mature hCG beta subunit having residues 47, 47, 51 and 58 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in male and female animals. See. ARMISO43, ARMISO43, ARMISO61-RISISS and ARMISJ61-RISI99.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is an analogue of mature hCG beta subunit having residue l16 replaced by a Cys residue. This introduces an additional cleaves This for CMBr, useful for determining the disulphide bonds. This can be used to show that mutagenesis has not altered the "normal disulphide pattern of analogues, and for see Ammining protein folding" disulphide pattern of analogues, and for see AMR15041, AAR15061-R15125 and AAR15161-R15198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                 Glycoprotein hormone; human chorionic gonadotropin; disulphide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human chorionic gonadotropin beta subunit structure I.
                                                                                                             hCG histidine substitution mutant, G8.

The chimeric hormone may be useful for identifying residues which are important for binding to the human records and may also have applications as an immunogen, see AARISO43, AARISO61-RISI25 and AARISO61-RISI98.

The sequence is an analogue of mature hCG beta subunit having residues 36, 60-26, 55 and 67 replaced by the corresponding residues in the bovine Life protein. The chimeric hormone may be useful for identifying residues within are important for binding to the human receptor and may also have applications as an immunogen, see ANRIGH31 ANRIGOGI-RISI23 and ANRISIGI-RISI398.
                                                                                                                                                                                               New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.

                                                                                                                                                                                                                                                                                                                                                             The present sequence is a fragment of the beta subunit of human chorionic gonddotropin (EGG). It is given in a specification relating to a vaccine composition capable of eliciting antibody formation against the face. The vaccine comprises an HCG polypeptide coupled to diphiberia toxoid or tetanus toxoid and a vehicle comprising a mixture of mannide monoclaste with squalane or squalene, The vaccine is useful for contraception, abortion or treatment of hormone related disease states and disorders and the treatment of hormone-associated carcinomas.

                                                                                                                                                                                                                                                                                                                                               The sequence is an analogue of mature hCG beta subunit having residues 18, 22, 29, 30 and 32 replaced by the corresponding residues in the boune LM protein. The chimeric hormone may be useful for identifying residues within are important for binding to the human receptor and may also have applications as an immunogen, seen ARR10443, ARR1061-R1512 and ARR15161-R15199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       manna: chorionic gonadotrophin: chorionic gonadotropin; beta-hCG; beta subunit; andio-terminal loop; mutant; reduction: LH; vaccine; contragestative medicoment; Cross-reactivity; lucinising hormone; contraceptive; faminossay; kaposi sarcoma; inhibition; electralising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chorionic gonadotrophin beta subunit amino-terminal loop mutant.
                                                                                                                                                                                    New glyco-protein hormone analogues - for inducing fertility ;
immuno-castration agents, for suppressing reproductive system
development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Outery Match

NAME OF STREET AND STR

```
The sequence is that of a modified form of human chorionic gonadotrophin (hCG), analogue. "O', in which amino acids in the "O' and/or" o' regions have been subtilitude resulting in changes in the binding specificity and avidity of luteinising hormone (LB) and follicle stimulating hormone (CB) receptor. It is was used in the pream of an alpha, beta-heterodimentic polypeptide having an affinity to vertebrate LH and FSB: LE acceptors. Such an analogue can be prepared having a desired ratio of FSB: LB activity. The polypeptide may be used for treating human infertility or polycystic ovarian disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62 DVRFESIRLPGCPRGVNPVVSYAVALSCQCALCRRSTTDCGGPKDHPLTCDDPRFQDSSS 121

luteinising hormone receptor; follicle stimulating hormone receptor;
vertebrate; polycystic ovarian disease.
                                                                                                                                                                                                    The sequence is an analoque of mature hCG beta subunit having residues 89; 91, 92, and 97 replaced by the corresponding residues 10; 91, 92, 95 and 97 replaced by the corresponding residues 10 the bovine LH protein. The chimeric hormone may be useful for identifying residues which art importent for binding to the human receptor and may also have applications as an immunogen, agonist and/or antegonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         94...*

                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is an example of a glycoprotein hormone beta-chain
canalogue used to construct an alpha, beta-heterodimer polypeptide
with altered binding affainty to LH receptor and FSH receptor. The
content preferably contains an HGG alpha-subunit and a chimaeric
beta-subunit containing HGC, LH, FSH and/or thyrotropin residues.
Containing affainty may be altered without disrupting
the containing HGC, LH, FSH and/or thyrotropin residues.
Containing affainty may be altered without disrupting
the terodimer formation or reaction with antibodies. The pregion of
HGG is most important for reaction with antibodies. The pregion of
HGG is most important for the receptor binding, and the G-region is
contained in the receptor and analogue. Dispute the captor with considerably lower potency thank HGC,
contained in a CGS-7 cell culture. This type of hormone analogue
contained the contained in the contained of the contained of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; single chain gonadotropin analog no:1b; anti-infertility; drug; peptide therapy; lucefulising hormone; LH; follicle stimulating hormone; FSH; thyroid stimulating hormone; TSH; chorionic gonadotropin; CG; glycoprotein; infertility; fusion protein; mutean; mutean.

Note: The present sequence is not shown in the specification, but is derived from the human single chain gonadotropin analog no:1 shown as SEQ ID NO: 3, in figure 5 of the specification (AAEO4474).
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                            The sequence is an analogue of mature hCG beta subunit having residues 39, 41, 42 and 41 steplaced by the corresponding residues in the hFSH protein. It was prepd. by site directed mutagenesis of a cDNA sequence encoding the hCG beta subunit. The climenic hormone is capable of directing hormone binding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female animals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
three or more peptide monomers which may be used as an immunocontraceptive and/or aboriticatent. The peptide andonomers are factured from the C-terminal portion of the human chorionic peptides derived from the C-terminal portion of the human chorionic genedictopin beta subunit (HGC-beta) comprising either residues 105-145 cc of HCC beta (AAV87501) or residues 111-145 of HCC-beta (AAV876480). By the peptide monomers are non-immunogenic; bawever the homopolymer is capable of inducing anti-HCC antibody production HCC plays a role in the maintenance of pregnancy, and has also been shown to induce ovulation and stimulate corpus intend function. Anti-HCC antibodies are alsed against the homopolymer of the invention are not cross reactive with lutenisising homomo (HB). The first 10 residues of HCC-beta are thrushly identical to those of LB, and prior art anti-HCC antibodies are thrushly identical to those of LB, and prior art anti-HCC antibodies are thrushly identical to those of LB, and prior art anti-HCC antibodies are thrushly coarse early abortion by neutralising CG in the perinancy is disrupted almost immediately after Corpus intenm. The pregnancy is disrupted almost immediately after corpus content of female fertility. The present sequence represents the beta exemplification of the present enveronment of none exemplification of the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cysteine knot protein; protein formation; heterodimeric protein analog; deglycosylated glycoprotein hormone; infertility; immunogen; antigen; polycystic ovarian disease; hGS, hyman; chorlonic gonadotrophin; beta subunit; therapy; Jun.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     62 DVRFESIRLPGCPRGVMPVSYAVALSCOCALGRRSTTDGGGRRDHPLTGDDRRFQDSSS 123 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 111

                                                                                                                                                                     A movel fusion protein comprises 2 dimer forming co-expressed anino acid sequences, each consisting of a homodiment or heterodiment receptor child or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a heterodiment protein homome capable of forming a heterodimer with the homomes so ther subunits. The fusion protein, e.g. the thromopoletin (PO)/human chorionic gonadcirophin-beta subunit (hGC-beta) fusion protein denoted by the present sequence, significantly increases the biological activity of the homome component, reducing the requirement for homome liself and the number of injections needed.
                              Hybrid dimeric protein comprising two co-expressed units - each based on receptor or ligand and a subunit of a heterodimeric hormone, especially FSH, for inducing follicular maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New glyco-protein hormone analogues - for inducing fertility as immuno-castration agents, for suppressing reproductive system development and as immuno-contragestive vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glycoprotein hormone; immuno-castration;
immuno-contragestive; vaccine; human chorionic gonadotropin;
luceinising hormone; LH; GG; bovine.

                                                                                                                                                                                                                                                                                                                 The sequence is an analogue of mature hcd beta subunit having residues 59-64.66, 67, and 69 repiaced by the corresponding residues in the hFSH protein. It was prept. by site directed mutagenesis of a coNA sequence encoding the hCo beta subunit. The chimeric hormone is capable of directing hormone binding to both Li and FSH receptors and may be useful for the treatment of infertility in man and women and the promotion of fertility in male and female animais. (see ANR15041, ANR15061-R15125 and
                                 The sequence is an analogue of mature hCG beta subunit having residues 2, 3, 9, 10, 18, and 22 replaced by the corresponding residues in the bowine LH protein. The chimaric hormone may be useful for identifying residues which are important for binding to the human receptor and may also have applications as an immunogen, agonist and/or antagonist.

It was preed: by site directed mutagenesis of a cDMA sequence encoding the hCG beta subunit. The Chimeric hormone is capable of directing hormone blanding to both LH and FSH receptors and may be useful for the treatment of infertility in men and women and the promotion of fertility in male and female annials. (See AARISO43, AARISO61-RISI25 and

The chimeric hormone may be useful as a TSH antagonist for the treatment of hyperthyroidism.

```

```
The sequence is an analogue of mature hCG beta subunit having residues 77, 82, 83, 89, 91, 22 and 99 replaced by the corresponding residues in the human LH protein. The chimeric hormone may be useful in the treatment of infertility in men and women and the promotion of fertility in man and female animals.
